Well Completion Design, Volume 56 (Developments In Petroleum Science)

Synopsis

Completions are the conduit between hydrocarbon reservoirs and surface facilities. They are a fundamental part of any hydrocarbon field development project. They have to be designed for safely maximising the hydrocarbon recovery from the well and may have to last for many years under ever changing conditions. Issues include: connection with the reservoir rock, avoiding sand production, selecting the correct interval, pumps and other forms of artificial lift, safety and integrity, equipment selection and installation and future well interventions. * Course book based on course well completion design by TRACS International* Unique in its field: Coverage of offshore, subsea, and landbased completions in all of the major hydrocarbon basins of the world.* Full colour

Customer Reviews

This is an excellent book covering a vast content of well completions engineering. I am please with this acquisition. Though, dropped the ball when packing my book. The book was not shipped in an individual package (I bough 4 items within the same order) and the edges of the cover were damaged. If a proper job had been done, my book would have arrived in perfect conditions, even sharing the box with other stuff.

covers most completion types in sufficient depth

Thorough and excellent. Some tricky concepts presented simply. A reference that sits on my desk as a second opinion that is consulted regularly.

The book goes very deep in petroleum completion subject, making use of a simple language that turns this book very useful not only for specialists.

Excellent book. It contains usefull information and in a friendly way.Regarding the delivery is was good but it arrives with the edges a bit crushed, therefore all the pages has a natural bending in the upper right corner. Not big deal.
